A lease pilot preserves the option to build

25 MW baseline facility

6.25 MW conditional first phase

No signed demand or firm grid terms

Base-case cost per productive GPU-hour

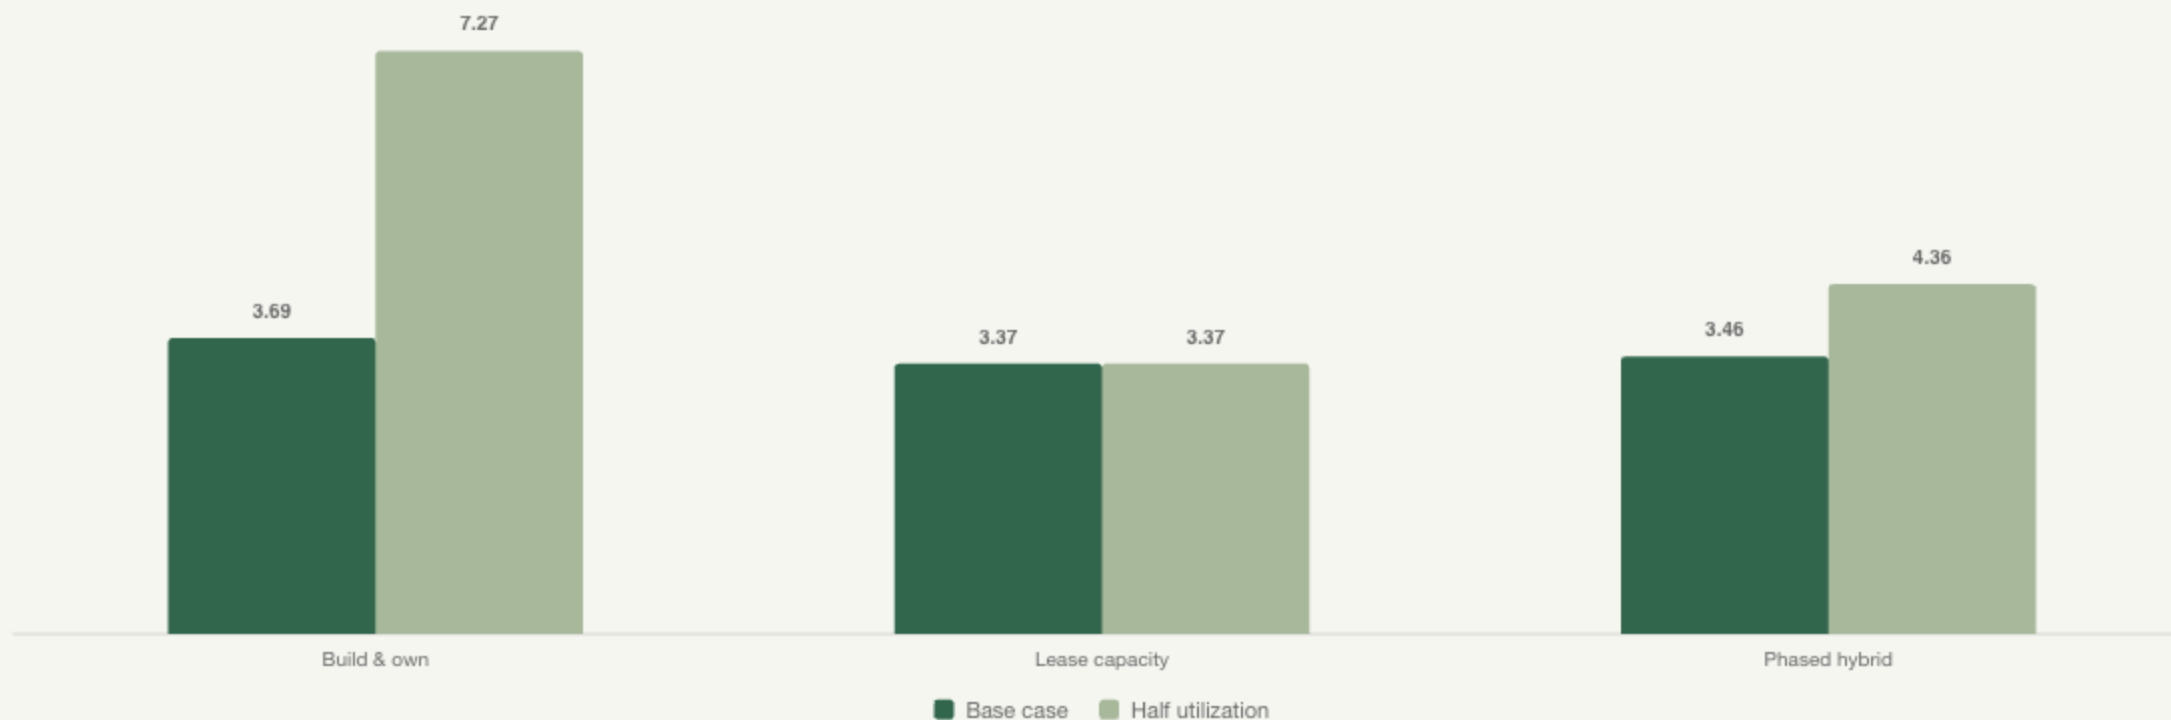

\$3.37

Lease case

\$59.8m before opening
\$239.1m annual opex

Assumed prices and demand. Unit cost includes lifecycle capital costs.

Low utilization raises ownership cost

USD per productive GPU-hour. Fixed demand commitments could change the lease result.

First-phase resilience remains unverified

6.25 MW

Conditional total site demand

300 MWh

Energy for 48 hours at full load

One failed transformer: transfer to the independent path

One failed generator: four remaining units must carry load

Cooling and fuel logistics remain critical dependencies

Evidence needed before construction

Signed demand

GPU-hour commitments and measured job traces

Binding power terms

Tariff, upgrade liability, energization date and outage tests

Comparable supplier bids

Hardware benchmarks, cloud scope, replacement and exit costs
